Srinagar, India

Professional Profile

Software Engineering graduate focused on BTC/USDT perpetual futures, rule-based trading, multi-timeframe technical analysis, and systematic strategy evaluation. I developed a Python-based backtesting tool with a Streamlit dashboard to test trading rules against historical market data.

I am seeking an opportunity to contribute to a trading or research team through disciplined market analysis, clear trading rules, risk-aware position sizing, and transparent performance evaluation.

CORE FOCUS

BTC/USDT perpetuals	Rule-based setups	Python backtesting	Risk analysis

Performance figures in this portfolio are historical backtest results supplied in the source document. They are not independently audited and are not live trading results.

01 | Strategy Framework

My approach prioritizes selectivity and repeatable rules rather than frequent trading or a large number of indicators.

Session-based analysis

The London session provides market context and helps assess price behavior around the daily reference level. Trade execution is considered during the New York session, after the first two 3-minute candles have been skipped.

Anchor level and timeframe alignment

Component	Role in the strategy
5:30 AM candle close	Daily reference/anchor level; timezone needs to be explicitly documented in the strategy configuration.
15-minute chart	Session behavior, market structure, and price relationship to the anchor level.
3-minute chart	Entry conditions and short-term price-action confirmation.
3-period EMA	Short-term confirmation on the 3-minute timeframe.
4-hour 50-period EMA	Directional filter for bullish or bearish setups.
Candlestick patterns	Bullish and bearish engulfing patterns are used as confirmation.

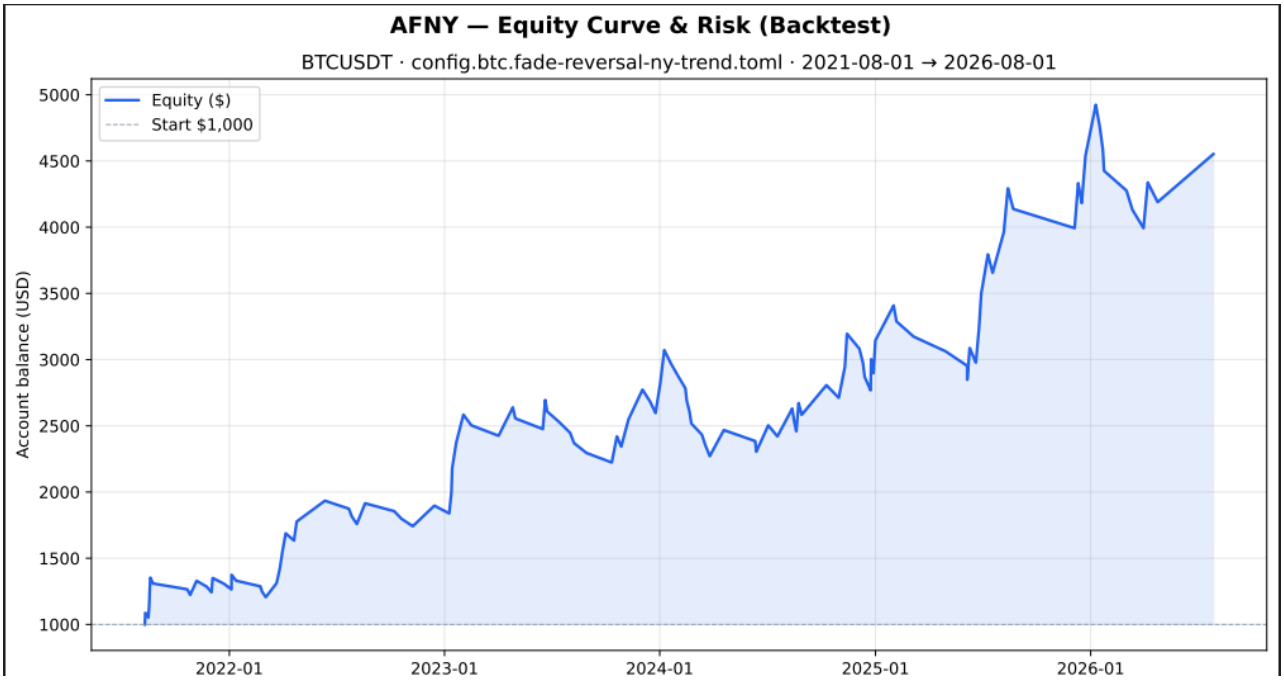

Execution workflow

1. Mark the close of the 5:30 AM reference candle. 2. Analyze the London session and anchor-level behavior. 3. Prepare for the New York session. 4. Ignore the first two 3-minute candles. 5. Wait for a qualifying setup and confirmation. 6. Apply the 4-hour EMA direction filter. 7. Calculate position size and planned risk. 8. Enter only when all required conditions align; otherwise, do not trade.

Trading rules described in the source: BTC/USDT perpetual futures; maximum one trade per day; avoid weekend trading; predefined stop-loss and target; position sizing should be based on risk and stop distance.

02 | Backtest Results

The source equity-curve diagram is included below. It shows the reported balance rising from around $1,000 to approximately $4,552 over the stated test window. The chart is based on backtest assumptions, not live trading.

118	39.83%	+$3,551.77	+355.2%
Reported total trades	47 wins / 71 losses	Reported net P&L;	Return on $1,000 start

Arithmetic checks

• 47 wins + 71 losses = 118 trades. • 47 ÷ 118 = 39.83% win rate. • $1,000 + $3,551.77 = $4,551.77 final equity. • $3,551.77 ÷ $1,000 = 355.18% return, rounded to 355.2%. • $3,551.77 ÷ 118 = $30.10 net expectancy per trade, if the selected net-P&L; summary applies to all 118 trades.

03 | Annual Results

Calendar-year results with chained equity (after fees). Trade counts by exit year.

Period	Trades	Win rate	Return	Start equity	End equity
2021 (Aug-Dec only)	13	46.2%	+30.7%	$1,000.00	$1,306.84
2022	21	42.9%	+45.2%	$1,306.84	$1,896.95
2023	23	39.1%	+36.9%	$1,896.95	$2,596.78
2024	32	34.4%	+21.1%	$2,596.78	$3,143.54
2025	19	47.4%	+44.4%	$3,143.54	$4,537.97
2026 (Jan-Jul only)	10	30.0%	+0.3%	$4,537.97	$4,551.77
Overall total	**118**	**39.83%**	**+355.2%**	**$1,000.00**	**$4,551.77**

04 | Data, Method & Limitations

Reported data setup

Item	Reported details
Market	BTCUSDT perpetual (Binance USD-M / UM futures).
Data provider	Binance Vision monthly USD-M futures kline ZIPs.
Test window	1 August 2021 inclusive to 1 August 2026 exclusive.
Intervals	3-minute entries/exits; 15-minute session/anchor context; 4-hour trend EMA; daily 30-day regime return.
Effective taker fee	0.045% per notional side, as described in one report (0.05% × 0.9 discount).
Slippage / funding	One detailed report uses $0 slippage and $0 funding; funding was disabled and slippage was not modeled.
Fill assumptions	Entry at exact 3-minute signal close; stop/target at exact level when touched; no spread, extra stop ticks, partial fills, or latency.
Out-of-sample test	No formal locked out-of-sample or walk-forward test is reported. Rules and parameters were adjusted using the same full period.

05 | Technical Project & Career Objective

Python-Based Trading Backtester & Streamlit Dashboard

I developed a Python-based tool to evaluate a rules-based BTC/USDT perpetual futures strategy on historical market data. The project provides a repeatable way to test strategy conditions and inspect performance outcomes through a Streamlit interface.

Area	Skills / experience described
Programming	Python
Interface	Streamlit dashboard
Trading research	Rule-based backtesting, trade statistics, position sizing, risk parameters, historical performance analysis
Market analysis	BTC/USDT specialization, candlestick interpretation, session-based and multi-timeframe analysis
Integration	Binance API integration is described in the source; specify the exact use case (data retrieval, testnet execution, or both) when publishing the project.

Professional strengths

- Structured analytical thinking and pattern interpretation
- Ability to translate trading ideas into explicit rules
- Software engineering applied to financial-market research
- Independent development and use of backtesting software
- Awareness of position sizing, transaction costs, and drawdown
- Focus on selective setups and disciplined process

Career objective

As a 2026 Software Engineering graduate focused on cryptocurrency market analysis and systematic strategy research, I aim to contribute to a professional trading or research team. I bring a combination of technical development skills, market study, and experience building tools to evaluate trading rules. My goal is to continue improving strategy validation, risk analysis, and evidence-based decision-making.
